Comparative Analysis of Customer Satisfaction Across E-Commerce Platforms: A Research Review

Prof. Dr. Pawar S. B., Prof. P. P. Deshmukh, Sarthak Tulashidas Jadhav
Vidya Niketan Institute of Management & Computer Application, Bota

Abstract: *E-commerce has changed how customers search for, compare, purchase and return products. As competition among online marketplaces grows, customer satisfaction has become an important indicator of platform performance and long-term loyalty. This research review examines factors shaping satisfaction, including product quality, price and value, website and application usability, delivery performance, payment security, customer support and return policies. It discusses how platforms such as Amazon, Flipkart, Myntra and Meesho may be compared using a common framework while recognising that experiences differ by product category, location, seller and order. The review draws on established research about e-service quality, online trust, perceived value and satisfaction. It proposes practical indicators such as satisfaction ratings, delivery reliability, complaint resolution, repeat-purchase intention and recommendation likelihood. This paper does not claim to report original survey results; instead, it presents a method for future empirical research and highlights limitations such as review bias, changing policies and differences among customer groups. It concludes that satisfaction is multidimensional and no platform can be assumed to perform best for every customer or category.*

Keywords: E-Commerce, Customer Satisfaction, Online Shopping, E-Service Quality, Trust, Delivery, Customer Loyalty

I. INTRODUCTION

The growth of internet access, smartphones and digital payments has made online shopping a routine part of consumer life. Customers can compare products, read reviews, place orders and request returns without visiting a physical store. E-commerce platforms compete not only through product range and price but also through the quality of the entire shopping experience.

Customer satisfaction refers to a customer's evaluation of whether a product or service experience meets or exceeds expectations. In online shopping, the experience begins with search and product information and continues through checkout, delivery, after-sales support and returns. A low price may attract an order, but late delivery, inaccurate descriptions or difficult refunds can reduce satisfaction and trust.

This review proposes a comparative framework for major e-commerce platforms used in India. Amazon and Flipkart offer broad product categories, Myntra focuses strongly on fashion and lifestyle, and Meesho is known for value-oriented shopping and a wide seller base. These descriptions indicate different market positions, not a ranking of satisfaction. A fair comparison requires consistent questions, comparable customer groups and recent evidence.

II. OBJECTIVES OF THE STUDY

- To identify the main factors influencing customer satisfaction in online shopping.
- To explain a common framework for comparing customer experiences across e-commerce platforms.
- To discuss the relationship between satisfaction, trust, loyalty and repeat purchase.

- To identify challenges in measuring satisfaction and suggest directions for future research.

III. KEY CONCEPTS

3.1 Customer Satisfaction

Customer satisfaction is an overall judgement formed by comparing expectations with perceived performance. It may be measured through overall satisfaction, ratings for individual service stages, complaint experience and willingness to use the platform again. Satisfaction can vary between orders even for the same customer.

3.2 E-Service Quality

E-service quality concerns how effectively a digital service enables customers to search, select, purchase and receive products. Common dimensions include efficiency, system availability, fulfilment, privacy and responsiveness. Fulfilment is especially important because the promised product must arrive correctly and on time.

3.3 Trust and Perceived Risk

Customers cannot physically inspect most products before purchase. They rely on product descriptions, images, ratings, seller information, payment safeguards and return policies. Clear communication and dependable problem resolution can strengthen trust, while counterfeit concerns, hidden charges or uncertain refunds can increase perceived risk.

3.4 Customer Loyalty

Satisfied customers may be more likely to return to a platform, recommend it to others and develop a preference for it. However, loyalty is not identical to satisfaction: customers may continue using a platform because of discounts, convenience, product availability or limited alternatives.

IV. FACTORS AFFECTING CUSTOMER SATISFACTION

4.1 Product Information and Quality

Accurate descriptions, photographs, size charts, specifications and verified reviews help customers make informed decisions. Satisfaction declines when delivered products differ from their online presentation, arrive damaged or do not meet expected quality.

4.2 Price, Discounts and Value

Customers assess total value received, not only the listed price. Delivery fees, platform charges, discount conditions and refund amounts affect perceived value. Transparent pricing can support satisfaction more reliably than temporary discounts.

4.3 Website and Mobile Application Usability

Simple navigation, relevant search results, useful filters, fast loading and a low-friction checkout reduce effort. Application errors, confusing product variants and payment failures can interrupt the buying process.

4.4 Delivery and Order Fulfilment

Delivery speed matters, but reliability and accurate tracking are also important. Customers expect the correct item, appropriate packaging and timely updates. Performance may vary by location, seller and product type.

4.5 Payment Security and Privacy

Customers need confidence that payment information and personal details are handled securely. Familiar payment options, clear transaction confirmations and effective handling of failed payments can improve confidence.

4.6 Customer Service, Returns and Refunds

Support quality is tested when an order is delayed, damaged or incorrect. Easy access to assistance, clear return eligibility, predictable pickup and prompt refunds can improve the overall experience.

V. COMPARATIVE FRAMEWORK FOR E-COMMERCE PLATFORMS

A meaningful comparison should evaluate platforms with the same dimensions and a clearly defined study period. The following framework can be used to compare Amazon, Flipkart, Myntra and Meesho. It is an assessment template, not a statement of measured platform rankings.

International Open-Access, Double-Blind, Peer-Reviewed, Refereed, Multidisciplinary Online Journal
ISSN: 2581-9429 Volume 6, Issue 6, October 2026 Impact Factor: 8.2

Dimension	What to measure	Suggested indicator
Product experience	Accuracy, quality and product match	Product satisfaction rating
Price and value	Price transparency, fees and value	Value-for-money score
Usability	Search, filters, checkout and app reliability	Ease-of-use rating
Delivery	Timeliness, tracking and order correctness	On-time delivery rate
Trust and security	Payment confidence, privacy and seller credibility	Trust rating
Support and returns	Response time, resolution and refund experience	Issue-resolution satisfaction
Overall outcome	Overall experience and future preference	Satisfaction; repurchase intention

5.1 Platform Context

Amazon and Flipkart can be assessed across broad product categories and fulfilment options. Myntra should be evaluated with attention to fashion-specific factors such as size and fit information, style accuracy and apparel returns. Meesho comparisons may pay particular attention to affordability, seller and product consistency, delivery communication and returns. These are context areas to investigate, not conclusions about which service performs better.

5.2 Interpreting Results Fairly

A single average score can conceal important differences. Results should be broken down by category, delivery region, order value and shopping frequency where appropriate. The sample should include recent users of each platform and distinguish customers who experienced a problem from those whose orders were completed normally.

VI. PROPOSED RESEARCH METHODOLOGY

This paper is a literature-based research review and proposes a method for a future comparative survey. No original customer survey, sample size or platform score is claimed in this document.

Research design: descriptive and comparative study using a structured questionnaire.

Target respondents: customers who purchased from at least one selected platform during a defined recent period.

Sampling: report the number of respondents for each platform; do not present a convenience sample as representative of all Indian shoppers.

Data collection: use a five-point Likert scale for product information, value, usability, delivery, trust, support and overall satisfaction.

Analysis: calculate dimension-wise means and distributions, compare platforms only where groups and sample sizes are adequate, and report missing responses.

Ethics: obtain informed consent, avoid unnecessary personal data and report findings honestly, including limitations.

Possible questionnaire statements include: “The product information was accurate”; “My order arrived within the promised time”; “The return and refund process was clear”; “I trust this platform with online payments”; and “I intend to purchase from this platform again.” Respondents should be allowed to select “not applicable” when they have not experienced a particular service.

VII. CHALLENGES AND LIMITATIONS

7.1 Review and Rating Bias

Online reviews may overrepresent customers with unusually positive or negative experiences. Some reviews may be incentivised, duplicated or unrelated to the exact product variant. Star ratings should be interpreted alongside review content and other service indicators.

7.2 Differences in Products and Locations

A platform may perform differently for electronics, groceries, fashion or household products. Delivery conditions also vary between metropolitan and rural areas. Comparing raw scores without considering category and location can mislead.

Impact Factor: 8.2

7.3 Changing Policies and Promotions

Prices, delivery promises, seller policies, return eligibility and promotional offers change over time. A study should record its data collection dates and avoid treating temporary conditions as permanent characteristics.

7.4 Measuring Satisfaction

Self-reported satisfaction is subjective and can be influenced by expectations, mood, brand familiarity and recent experiences. Survey responses should be combined, where possible, with observable indicators such as delivery reliability and resolution time.

VIII. FUTURE SCOPE

- Use a larger, geographically diverse sample to compare customer groups across India.
- Study satisfaction by category, including fashion, electronics, grocery and home products.
- Analyse customer reviews using sentiment analysis and check automated results against human interpretation.
- Examine how delivery reliability, refund speed and complaint resolution affect repurchase intention.
- Repeat the study over time to understand changes in policies, technology and customer expectations.
- Explore accessibility, regional-language support, sustainable packaging and responsible use of customer data.

IX. CONCLUSION

Customer satisfaction in e-commerce is shaped by the complete customer journey rather than a single feature such as price or delivery speed. Product accuracy, perceived value, usability, fulfilment, trust, customer service and returns all contribute to the final evaluation. A useful comparison of Amazon, Flipkart, Myntra and Meesho must apply common measures while recognising differences in product categories and customer needs. Established research provides concepts for evaluating electronic service quality, online trust and satisfaction, but it does not justify assuming a universal winner without current and comparable data. The proposed survey framework offers a practical starting point for future research. Reliable findings depend on transparent sampling, consistent questions, careful analysis and clear acknowledgement of limitations.
