Using AI Encountering Fake News

Darshit Uday Jagtap and Uday Rote
Institute of Distance and Open Learning, Mumbai, Maharashtra, India

Abstract*: The COVID 19 pandemic is a humanitarian crisis that poses a serious risk to society, has an effect on a number of social media sites, and has a negative influence on journalism. As a venue for information consumption, news and social media have grown incredibly popular. The widespread dissemination of false information might harm social media websites. Determining fake news in the current environment is therefore necessary. In this article, we review recent work on several techniques for identifying bogus news on the Internet. I have initially spoken about fake news in general and the numerous terminology associated with it that have been studied in the literature. In addition, I have highlighted several publicly accessible statistics and other web resources that may be used to disprove claims.*

Keywords: Fake news detection, Internet, content context, social context
