Abstract: *Due to the fasting moving technical world all are busy in our routine life, without getting the time to pay heed on the social problems occurring in the society. These problems remain unaddressed by the public because of the lack of time coordination and lack of moral untechnical support. Hence our project aims at creating a platform for solving these issues. By taking the help of relevant departments and social workers into picture for help. This project aims at capturing the real-time photos of social problems and sending it to the relevant sectors to solve in the stipulated time. In an era of dynamic and innovative solutions, its designed to revolutionize the way social work is administered, executed, and experienced. This project addresses this demand by creating a seamless ecosystem that caters to the unique requirements of three distinct user groups: Administrators, Social Workers, and Users. For Administrators, the system provides a robust suite of tools that enables them to not only log in and oversee social work activities, but also to verify and manage user complaints. This Social Work Management System represents a significant step in optimizing the social work process, promoting collaboration, and ultimately improving the lives, who rely on social services*
