Abstract: *Small businesses typically use a single cloud server to host multiple projects, and their databases are sometimes hosted on the same server. As a result, all projects are hosted in the same environment. This will cause problems in the future, such as the inability to upgrade the server's environment because all projects are dependent on the same environment; in the future, that environment support will be discontinued; or in the future, if the database fails, it will affect all projects that hosted on the server.*

Keywords: Cloud Server, Databases, Hosted, Environment
