Abstract: *Gases that trap heat in the atmosphere are called greenhouse gases. This section provides information on emissions and removals of the main greenhouse gases to and from the atmosphere. Click on a greenhouse gas below to learn about its emissions in more detail. Global warming is defined as the increase in the Earth's atmosphere and ocean temperatures over time, primarily due to human activities such as the burning of fossil fuels and deforestation, which raise the concentration of greenhouse gases like carbon dioxide. This phenomenon leads to climate changes that can disrupt ecosystems and threaten food supply and living environments.*

Keywords: *Gases*
