

# Use of Artificial Intelligence Chatbot System for Providing Health Related Information

Nagnath Dudhnikar<sup>1</sup>, Pratik Padyal<sup>2</sup>, Prof. Shamika Jog<sup>3</sup>

Student, Department of E&TC, NBN SINHGAD college of Engineering, Pune, India<sup>1,2</sup>

Associate Professor, Department of E&TC, NBN SINHGAD college of Engineering, Pune, India<sup>3</sup>

**Abstract:** Artificial Intelligence has core branches like, Machine Learning that takes in knowledge, searches patterns, improves itself mistreatment the information, and displays the result. to steer healthy manner attention is extremely abundant necessary. In few unsocialized areas, it's quite exhausting to search out a consultation with a doctor that simply relating to health problems. the most plan here is to form a attention chatbot supported computer science mistreatment IP which will diagnose the malady and supply needed details regarding the particular malady before consulting or visiting a doctor. Reduces the attention prices and improves accessibility to the present medical chatbot. Specific chatbots act as virtual medical help, that helps the patient recognize a lot of regarding their malady and helps to boost their health. The user is able to do the \$64000 good thing about a chatbot only it will diagnose every kind of diseases and supply the mandatory data. A text-to-text medical chatbot involves patients in on-line language considering their health issues that provides a group of customized diagnoses supported their provided symptoms. These bots connect with the potential patients visiting the positioning, serving to them discover specialists, booking appointments, and obtaining them access to correct treatment. This chatbot uses tongue process techniques to method and analyze the information and provides the output inappropriate manner. It brings up the disease-related issues regarding whether or not the task mentioned higher than ought to be allotted to human workers. This attention chatbot system can offer patients attention support on-line in the least times. It helps to come up with health knowledge and mechanically delivers the data of reports to medical management. By asking the queries asynchronous it helps the patient by guiding what precisely the user is searching for queries.

**Keywords:** Computer Science, Chatbot, Android, Program-o, etc.

## I. INTRODUCTION

Earlier, the bogus intelligence domain wasn't developed. once the invention of chatbot systems, the issues of user's area unit solved in less time. within the field of attention, automatic chatbot readying in net applications is booming everywhere the planet. Patients suffers from differing kinds of diseases and visit to hospital for treatment purpose. generally, doctors aren't obtainable thanks to that, time needed for nursing takes loads. to beat this issue, medical chatbots were developed. These chatbots area unit trained and tested on live dataset additionally accuracy of the output has relevancy. The AI primarily based chatbot area unit quick, reliable and precise. User offer the correct details and receive feedback in keeping with their question. If any user makes minor mistake, the chatbot provides validation and autocorrection options. Nowadays, in each clinic and hospitals portal chatbots area unit acting multitasking work. loads of your time of patient is saved and tasks area unit completed in minimum effort.

## II. TEMPORARY LITEARTURE SURVEY

[1] A Library maneuvers with a social thought of providing valuable data resources to those that can't afford an in-depth assortment of books for skilled help. it's in an exceedingly one amongst one in every of} the foremost assets in a faculty. therefore, a school focuses on maintaining and managing the main points of the library knowledge with at the most effectualness. The worth of any data resource are often judged supported its

information and utility and not on financial. thence it's necessary for an establishment to require care of providing the desired support to lecturers and students to.

[2] Effectively use the resources in an exceedingly library. the most objectives of this project area unit, Explore the Library resources to the users by adapting a synthetic Intelligence Technology straightforward communication between the user and also the chat larva. Anytime and anyplace. In recent times, chat bots have reduced the necessity for human intervention. computer science and machine learning have accelerated the evolution of chat larvas to blur the road between human and bot variety of interaction.

[3] {a chat a talk a language} larva could be a worm or computer science that conducts a conversation via auditive or matter strategies. Chat bots' area unit usually employed in systems that involves chatting with users to either acquire data or offer the service as data to them. In sure Chat bots tongue process is employed, however several of the Chat bots have their reply hold on in information that they retrieve once they receive associate input from user. in keeping with Finance Digest, AI can handle ninety fifth of the client interactions by 2025, which can release the necessity for human interaction. Such advanced AI technology would produce a self-learning system for chat bots, wherever chat bots will learn to retort with none scripts for each instance of a language.

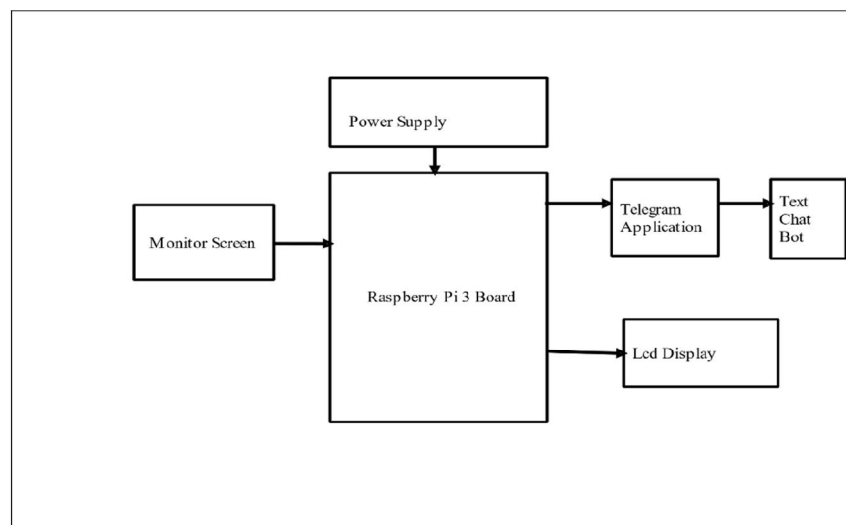

[4] Chabot's helps individuals by reducing the time they navigate in net by simply providing the data they search. Building client support is one in all the foremost progress for any business happening round the world. the expansion in technology has leveraged the client expectations like would like for a 24/7 service client support, instant response and answers for even straightforward queries which needs vast work force and information. Chat bots' area unit solutions build supported adapting AI technology to reshape the client service domain. Imagine for a moment, wherever rather than a person's being at a client support, Chat bots can facilitate United States of America offer the service for the client.

### III. IMPLEMENTATION

We area unit mistreatment 3 algorithms to implement health care chatbot system.

1. N-gram rule
2. TF-IDF (Term frequency-inverse knowledge frequency)
3. cos similarity rule

N-gram rule N-Gram's area unit thanks to facilitate machines perceive a word within the content to urge a much better understanding of word. N-gram could be a neighboring sequence of n-items from a given sample of text. N-items suggests that we will have 2 things, 3 things and then on. So, it's a contiguous sequence of some things.it helped to predicting following words in an exceedingly sentence. Things are characters, words, sentences.

**Figure 1: Block Diagram AI based Chatbot**

Term frequency (tf) usually, once building a model with the goal of understanding text, you'll see all of stop words being removed. Another approach is to attain the relative importance of words mistreatment TF-IDF. Range the amount the quantity} of times a word appears throughout a document divided by the complete number of words at intervals the document. every document has its own term frequency. Inverse knowledge Frequency (IDF) The log of the number of documents divided by the number of documents that contain the word. Inverse knowledge frequency determines the load of distinctive words across all documents within the corpus.

Cosine similarity finds a similarity between 2 non-zero vectors of associate real number area that measures the cos of the angle between them. this method is additionally wont to live cohesion among clusters at intervals the sphere of knowledge (data) mining.  $\cos \text{ similarity} = \frac{AB}{|A||B|}$ . cos distance is nothing but obtaining distance between 2 vectors in n dimension space. Distance represents but words related to each other.

### **Monitor Screen**

Chatbot applications need knowledge inputs asked by the user to be understood and hold on for usage and analysis. The input is sometimes sentences. The chatbot can extract the data from these sentences, perform tongue understanding and prepare a solution to be sent back to the user.

### **Raspberry Pi 3 b**

Raspberry pi is that the main controller of chatbot system. during this chatbot we tend to use raspberry pi 3b module.

### **Power Supply**

The official Raspberry Pi 12.5W small USB Power Supply is the newest counselled power offer for all small USB-powered Raspberry Pi computers.

### **Chatbot**

Text-to-text medical chatbots modify patients to speak regarding their medical issues and supply customized diagnosing supported symptoms.

## **IV. RESULTS**

## **V. CONCLUSION AND DISCUSSION**

Chatbot is useful gizmo for language between human and machine. the appliance is developed for getting a quick response from the larva which means with none delay it provides the proper result to the user. It's over that, the usage of chatbot is user friendly and could be used by somebody World Health Organization is attentive to the thanks to kind in their own language. Chatbot provides individualized diagnosing supported symptoms.

## **VI. ACKNOWLEDGMENT**

NBNSTIC, Pune and NCCC-2022 team for providing platform to gift our work. I'm grateful to faculty member. S. M. Jog Project Guide, for co-operation and suggestions. She has created valuable suggestions and gave steering throughout for finishing my project work.

I would like to specific deep devout because of my guide and Head of Department, Dr. Makarand M. Jadhav, for giving valuable steering and direction to my project work. He with patience provided the encouragement and motivation. His comments and precious suggestions created the complete journey to the ultimate accomplishment of this work extremely pleasant. I would prefer to impart Dr. Shivprasad P. Patil, Principal, NBN Sinhgad College of Engineering, Pune for providing wonderful facilities within the faculty to hold out this project stage-II work.
